A. Rate curve r(y)
How fast amyloid accumulates at each LEVEL.
Dashed red = the floor mu_b; dotted = threshold;
grey = outside the range of the data.

B. WITHOUT the cure component
Proper survival S(a) = P(not yet departed | susceptible).
Everyone departs eventually, so it falls to zero.
probability not yet departed

C. WITH the cure component
Improper survival 1 − pi F(a). It does NOT fall to zero:
it plateaus at the cure fraction 1 − pi.
probability never yet positive
