

### A. Rate curve $r(y)$

How fast amyloid accumulates at each LEVEL.  
Dashed red = the floor  $\mu_b$ ; dotted = threshold;  
grey = outside the range of the data.

### B. WITHOUT the cure component

Proper survival  $S(a) = P(\text{not yet departed} \mid \text{susceptible})$ .  
Everyone departs eventually, so it falls to zero.

### C. WITH the cure component

Improper survival  $1 - \pi F(a)$ . It does NOT fall to zero:  
it plateaus at the cure fraction  $1 - \pi$ .
